# OMRON Frequency/Rate Meter

# K3NR

# High-speed, Intelligent Interface Modules with Seven Operating Modes Convert Single or Dual Input Pulses to Display Values

- 50-kHz input range and 0.006% accuracy for sophisticated control.
- A wide selection of outputs: relay, transistor, BCD, linear, or communications.
- Maximum/Minimum value hold, set value write protection, and more.
- Banks with four comparative output values and four prescale values.
- Prescale function available, which displays in units of actual physical parameters (length, volume, etc.).
- Set value teaching, linear output range teaching, and prescale teaching are available using actual measured values.
- Displays values in hours, minutes, and seconds in operating mode 6.
- A startup compensation time parameter keeps the measurement operation from sending an unnecessary output for a preset period up to 99.9 s.
- Built-in sensor power supply (12 VDC, 80 mA).
- Compact 1/8 DIN size.
- Conforms to EMC standards, EN61010-1 (IEC61010-1).
- UL/CSA approved.

Basic Models		K3NR-NB1A	K3NR-NB2A	K3NR-PB1A	K3NR-PB2A
These models provide a present value LED and front-panel control keys. Can be connected to any Output Board, or can be used for display only without an Output Board.					
Set Value LED Models		K3NR-NB1C	K3NR-NB2C	K3NR-PB1C	K3NR-PB2C
These models provide a present value LED, set value LED, and front-panel control keys. Can be connected to Relay, Transistor, or Combination Output Boards.

Approved standards		UL508, CSA22.2; conforms to EN50081-2, EN50082-2, EN61010-1 (IEC61010-1); conforms to VDE106/part 100 (Finger Protection) when the terminal cover is mounted.				
Weight	Approx. 400 g					

Note: An Intelligent Signal Processor with DC supply voltage requires approximately 1 A DC as control power supply current the moment the Intelligent Signal Processor is turned on. Do not forget to take this into consideration when using several Intelligent Signal Processors. When the Intelligent Signal Processor is not in measuring operation (e.g., the Intelligent Signal Processor has been just turned on or is operating for startup compensation time), the display will read "DDDD" and all outputs will be OFF.

### Input/Output Ratings

#### Relay Contact Output

#### (Incorporating a G6B Relay)

Item	Resistive load (cos∳ = 1)	Inductive load ( $\cos\phi = 0.4$ , L/R = 7 ms)		
Rated load	5 A at 250 VAC; 5 A at 30 VDC	1.5 A at 250 VAC, 1.5 A at 30 VDC		
Rated carry current	5 A max. (at COM terminal)			
Max. contact voltage	380 VAC, 125 VDC			
Max. contact current	5 A max. (at COM terminal)			
Max. switching capacity	1,250 VA, 150 W	375 VA, 80 W		
Min. permissible load (P level, reference value)	10 mA at 5 VDC			
Mechanical life	50,000,000 times min. (at a switching frequency of 18,000 times/hr)			
Electrical life (at an ambient temperature of 23°C)	100,000 times min. (at a rated load switching frequency of 1,800 times/hr)			

#### **Transistor Output**

Rated load voltage	24 VDC max.
Max. load current	50 mA
Leakage current	100 μA max.

-

#### BCD Output

	I/O signal name	Item	Rating
Inputs	REQUEST, HOLD, MAX, MIN, RESET	Input signal	No-voltage contact input
		Input current with no-voltage input	10 mA
		Signal level	ON voltage: 1.5 V max. OFF voltage: 3 V min.
Outputs	DATA, POLARITY, OVERFLOW,	Rated load voltage	24 VDC max.
	DATA VALID, RUN	Max. load current	10 mA
		Leakage current	100 μA max.

Note: Logic method: negative logic

#### Linear Output

Item	4 to 20 mA	1 to 5 V	1 mV/10 digits (see note)
Resolution	4,096		
Output error	±0.5% FS		±1.5% FS
Permissible load resistance	600 Ω max.	500 Ω min.	1 KΩ min.

Note: For the 1 mV/10-digit output, the output voltage changes for every 40 to 50 increment in the display value.

#### Communications

lte	m	RS-232C, RS-422	RS-485		
Transmission meth	od	4-wire, half-duplex	2-wire, half-duplex		
Synchronization m	ethod	Start-stop synchronization			
Baud rate		1,200/2,400/4,800/9,600/19,200/38,400 bps			
Transmission code	•	ASCII (7-bit)		ASCII (7-bit)	
Communications	Write to K3NR	Comparative set value, prescaling value, remote/local programming, reset control of maximum/minimum values, and other setting mode items excluding communications conditions.			
	Read from K3NR	Process value, comparative set value, maximum value, minimum value, model data, err code, and others

**Derating Curve for Sensor Power Supply** 

**Note:** The derating curve shown is for standard installation. The derating curve depends on the mounting direction.

Nomenclature

1. SV Display	<u>,</u>		7. Status Indica	tors
2. PV Display				
Status Indicators	ASS	• _ • _ • _		
4. SV Display Status		8.8.8.8.8	T 8. Teaching Indi	icator
5. ESC Key	ESC C		ACH	СН Кеу
6. Mode Key			10. Up Key and	Shift Key

Name	Functions		
1. SV display	Displays the set value or parameter. Available for Set Value LED Models only.		
2. PV display	Displays the process value in addition to the max./min. value or parameter.		
3. Comparative output status indicators	Displays the status of comparative output.		
4. SV display status	Indicates which comparative set value is currently on the SV display.		
5. ESC Key	Used to return to the RUN mode from the Setting, Protect, or Maintenance mode. The process value, maximum value, or minimum value to be displayed can be selected.		
6. Mode Key	Used to enter the Setting mode. Used to allow the PV display to indicate set values sequentially. Available for Basic Models only. Used to indicate set values sequentially on the SV display. Available for Set Value LED Models only.		
7. Status indicators	HOLD:Lit when HOLD input is ON.MAX:Lit when the maximum value is indicated on the PV display.MIN:Lit when the minimum value is indicated on the PV display.PROG:Lit or flashes while parameters are being set.		
8. Teaching indicator	Lit when the teaching function is enabled and flashes when the Intelligent Signal Processor is in teaching operation.		
9. RESET/TEACH Key	The maximum value, minimum value, and counting values are reset by pressing this key. Teaching is available when the teaching function is enabled.		
10. Up Key and Shift Key	The digit being set is scrolled by pressing the Shift Key. The set value increases by one whenever the Up Key is pressed.		

# **Operation** -

# Setting Procedures

The K3NR has four modes: RUN mode for normal operations. Setting mode for initial parameter input. Protect mode for lock-out configuration. and Maintenance mode for initializing set values. The parameters that are accessible on any individual K3NR will vary depending on the Output Board installed. Refer to the K3NR Operation Manual for details.

- RUN Mode:
- Remains in this mode under normal operation.
- - The process value or the max./min. value can be monitored. Using the front panel keys, the comparative set value can be changed and max./min. value and counting value reset can be performed.
- Setting Mode: Used for making initial settings.

Includes settings for four menus (Set value ( $5\omega 5EE$ ), prescaling (PSLL), setup (5EEUP), option ( $\bar{a}PE$ )) and the output test. Protect Mode: Used for locking the front key operation or parameter changes.

Maintenance Mode:

Used for initializing set values.

#### 505EE - Program set values

- 5.6RnH Select bank no. of set values
- 5. LHH Enter set value HH of bank 1
- 5. H Enter set value H of bank 1
- 5. L Enter set value L of bank 1
- 5u I.LL Enter set value LL of bank 1

Note: The above is an example when the bank number is set to 1.

PSEL - Display prescaling

- P.bRoP Select bank no. of prescale values
- P5 LB2 Set the mantissa (X) of the prescale value of input A
- P5 LB3 Set the exponent (Y) of the prescale value of input A
- P5 Lbū Set the mantissa (X) of the prescale value of input B
- P5 I.69 Set the exponent (Y) of the prescale value of input B
- dEEP. / Select decimal point
- Note: The above is an example when the bank number is set to 1.

SEEUP - Program operating mode/input sensor/serial communications

- FlloF Specify operating mode
- īnR Select a sensor type of input A
- īпЬ Select a sensor type of input B
- Era.Ru Set the mantissa (X) of the auto zero time of input A
- Era.RY Set the exponent (Y) of the auto zero time of input A
- Set the mantissa (X) of the auto zero time of input B Ērā.bū
- Eraby Set the exponent (Y) of the auto zero time of input B

#### JPL - Supplementary settings related to display or control

- RUG Set the process time for averaging measured value
- SECRE Set startup compensation time
- ñEñõ Select power failure memory function
- 895 Enter hysteresis value
- C ZōUŁ Select the output pattern
- LSELH Enter the upper limit (H) of linear output range
- LSELL Enter the lower limit (L) of linear output range
- r ÜL Select the remote/local programming

EESE - Generating simulated input for testing the output function

Prot - Program lock-out configuration

Enable all key protection

the front panel keys

ing the front panel keys

ting in the setting mode

- 5625 Select the stop bits РгЕУ Select the parity bits

# Parameters Output Pattern Selection Elaute

The patterns of comparative output are selectable according to the level change. Select the pattern according to the application.

Note: The following setting conditions must be satisfied, otherwise no zone output will turn ON correctly. LL < L < H < HH

#### Startup Compensation Time Secret

The startup compensation time parameter keeps the measurement operation from sending an unnecessary output corresponding to instantaneous, fluctuating input from the moment the K3NR is turned ON until the end of the preset period.

The compensation time can be set in a range from 0.0 to 99.9 seconds as the waiting time until the devices subject to measurement become stable after the startup of the power supply.

#### Hysteresis H95

The hysteresis of comparative outputs can be set to prevent the chattering of comparative outputs. Refer to page 14 for more details.

#### Linear Output Range LSEE

A linear output range can be set as required. A value corresponding to the maximum output value and that corresponding to the minimum output value can be set.

### Remote/Local Selection r

Select remote programming when performing all settings through the host devices and select local programming when performing settings through key operation.

#### Prescaling

To display rotational speeds, circumferential speeds, or other values based on input pulse calculations, the rotational speed must be multiplied by a factor input before the input pulses are measured. This factor is called a prescale value.

#### Prescale Value Example

 $\begin{array}{l} \text{rpm}=\text{f} x \ 60 \ x \ \alpha \\ \text{Where,} \\ \text{f: Input pulse frequency (p/s)} \\ \alpha \text{: Prescale value} \\ \text{If there are 5 pulses per rotation, then an accurate rotations speed} \\ \text{can be calculated if } \alpha = 1/5 \ (= 0.2 = 2 \ x \ 10^{-1}). \\ \text{In actual application, input as follows;} \\ \text{Mantissa } X = \times 2.^{0000} \\ \text{Exponent } Y = \times 10^{-1} \end{array}$ 

#### Auto-zero Time

The time to force-zero the frequency if no pulse is received for a specified period can be set. This time is called the auto-zero time. Set the auto-zero time to a value that is somewhat longer than the longest input pulse interval. (If the time setting is too long or if the factoryset value is used, the display may not return to zero even if no input pulse is received.)

### Terminal Arrangement

# Input Unit

#### K3NR-NB (NPN Input/Voltage Pulse Input)

NPN Open Collector Output (NPN Linear 2-wire Output)

**Contact Output** 

Note: Connect the + side of the NPN linear 2-wire input to terminal 1 and the – side to terminal 11.

# Process Time for Averaging Measured Value

Process time for averaging measured value is the time over which the measured values will be averaged. If this time is shorter than the input pulse interval, processing will be based on the input pulse interval.

**Terminal Numbers** 

Note: Terminals 7 to 13 are connected internally.

**Note:** Terminals 7 and 13 are insulated from each other. When inputting the external control signals and input signals through the open collector:

Transistor Inputs: ON: Residual voltage must be 3 V max. OFF: Leakage current must be 1.5 mA max. The switching capacity must be 20 mA or greater.

When the external signal input is short-circuited, a voltage of approximately 5 V will be applied to between the terminals 5 to 7 and the COM terminal, and a current of approximately 18 mA (nominal value) will flow.

### K3NR-PB (PNP input)

### BCD Output Timing Chart

A request signal from an external device (such as a Programmable Controller) is required to read BCD data.

#### Single Sampling Data Output

Approximately 30 ms after the REQ signal rises, a sample is taken and the DATA VALID signal is output. Read the data when the DATA VALID signal is ON.

The DATA VALID signal will turn OFF in 40 ms, and then in 16 ms, the data will go OFF.

Models with a BCD output have an open collector output configuration so that wired-OR connection is possible.

#### **Continuous Data Output**

The K3NR outputs each measurement at an interval of 64 ms when a REQ signal is ON continuously.

If the HOLD signal is ON at the moment the DATA output is switched from Data 1 to Data 2 or vice versa, the output BCD data will be either Data 1 or Data 2 according to the timing of the HOLD signal. However, output data will never be below.

# Output Operation Timing in RUN Mode (Relay or Transistor Outputs)

The following timing chart is for a 5-comparative Output Board when the standard output pattern is selected.

#### For Operating Mode 1 to 6

### Operating Modes

The K3NR provides 7 operating modes for converting input pulses to display values. The mode can be selected via key operations on the front panel.

Basically, the operating modes can be divided into the following two groups.

#### **Operating Modes 1 to 6**

Rotational speed and other displays are based on calculations for continuous pulses (frequency).

Example

Operating mode no.	Use
01	Rotational/Circumferential speed
02	Absolute ratio
03	Error ratio
04	Rotation difference
05	Flow rate ratio
05	Passing time

Mode No. 1: Rotational or circumferential speed display for 1 input

 Mode No. 2 to 5: Display of calculations for two rotational speeds

 Mode No. 6:
 Passing time display based on 1 input frequency and processing length

#### **Basic Principles of Rotational Speed Displays**

The ON/OFF time (T) of a sensor input or other input is measured with the internal system clock to automatically calculate the frequency. This frequency is multiplied by 60 and displayed as a rotational speed.

Input sensor pulse ON/OFF time (T) =

Frequency (f) = 1/T

Rotational speed (rpm) = f x 60

Circumferential speed = Circumference x Rotational speed

Passing time = Processing length/Circumferential speed

Automatic measuring by the K3NR is enabled simply by providing an input pulse.

#### **Operating Mode 1: Rotational/Circumferential Speed**

The frequency of input A is calculated and displayed as a rotational or circumferential speed.

Units: rpm; rps; rph; Hz; kHz; mm/s; m/s; m/min; km/h; etc.

Winding Speed

#### **Operating Mode 7**

The number of pulses is measured. Each pulse is counted as 1 count up to a maximum of 99,999 counts. Decrementing the count is not possible. Although the limits of the display enables displaying only up to 99,999 counts, prescaling can be used to count up to 4 gi-gacounts.

Operating mode no.	Use	
רס	Pulse counting	

The count is reset by shorting terminals 6 and 7 (RESET ON) or by pressing the RESET/TEACH Key on the front panel

Because only incrementing is possible, the L and LL comparative outputs turn ON when the measured values exceed set values.

#### **Operating Mode 2: Absolute Ratio**

Input B is divided by input A (B/A) and then multiplied by 100 for display as a percentage.

Unit: %

**Application Example** 

#### Measuring Ratio between Rotational Speed of Two Rollers

#### **Operating Mode 3: Error Ratio**

The error between input A and input B (B/A - 1) is multiplied by 100 for display as a percentage.

Unit: %

Measuring Difference between Two Line Speeds (Two Conveyors)

# Operating Mode 4: Rotational Difference

The difference between input B and input A (B – A) is displayed as a rotational speed error or circumferential speed error.

Units: rpm; rps; rph; Hz; kHz; mm/s; m/s; m/min; km/h; etc.

**Application Example** 

Measuring the Absolute Difference between the Speeds of Two Conveyors

#### **Operating Mode 5: Flow Rate Ratio**

Input A and input B are used to find the concentration (B/(A+B)) as a percentage.

Unit: %

#### **Application Example**

Monitoring the Concentration of a Liquid Mixture

#### **Operating Mode 6: Passing Time**

The pulse frequency of input A is calculated and is displayed as the passing time for a preset distance.

**Units:** s; min; h, min, s; min, s, 1/10 s; etc.

The passing time measurement operation in operating mode 6 is ideal for measuring time corresponding to a frequency change. Operating mode 6 allows the real-time, continuous time measurement of the revolutions of any rotating object without recovery time.

**Application Example** 

Passing Time for a Conveyor Line

#### **Operating Mode 7: Pulse Counting**

The total number of pulses on input A is displayed.

Units: count; mm; cm; m; l; kl; etc.

**Application Example** 

**Counting Workpieces**
